

CST8507: NATURAL LANGUAGE PROCESSING

WEEK#11

LLM & RAG

DEVELOPED BY

HALA OWN, PH.D.

Lesson Agenda

- Introduction to LLM
- LLMs Components
- How ChatGPT trained
- Limitations of LLMs
- How Retrieval Augmented Generation **RAG** works
- LangChian

What is LLMs

- ❑ Trained on **massive amounts of text data.**
- ❑ Transformer architecture
- ❑ Understanding and generating human-like texts.
- ❑ Capable of **performing a wide range of NLP** tasks with high proficiency, including text completion, summarization,

A Timeline Of Existing Large Language Models

Image sources: <https://www.marktechpost.com/2024/11/09/a-deep-dive-into-small-language-models-efficient-alternatives-to-large-language-models-for-real-time-processing-and-specialized-tasks/>, Wayne Xin Zhao et al

LLMs Components

Comparison of Popular Large Language Models

Model	Parameters	Size on Disk	Memory Usage (Inference)	Learning Data Size
BERT (Large)	340M	~1.3 GB (FP32)	~1.5–2 GB (FP16)	3.3B words (~16 GB)
GPT-4o	~200B	~350 GB (FP32)	~400 GB (FP16, single GPU)	570 GB (~300B tokens)
LLaMA (13B)	13B	~26 GB (FP32)	~26 GB (FP16)	~1T tokens
LLaMA (70B)	70B	~140 GB (FP32)	~140 GB (FP16)	~1T tokens
BLOOM (176B)	176B	~352 GB (FP32)	~352 GB (FP16)	1.6T tokens
Mistral 7B	7B	~14 GB (FP32)	~14 GB (FP16)	~1T tokens
Mixtral 8x7B	56B	~112 GB (FP32)	~112 GB (FP16)	Unknown (large corpus)
Grok (xAI)	Unknown (est. ~70B)	Est. ~140 GB (FP32)	Est. ~140 GB (FP16)	Unknown (large)
PaLM (540B)	540B	~1 TB (FP32)	~1 TB (FP16)	780B tokens

LLM Tokenizer

<https://tiktokenizer.vercel.app/>

Context Length

The **maximum number of tokens** an LLM can process at once.

Includes:

- prompt
- conversation history
- generated answer

Context Length :Comparison of Various LLMs

Types of large language models

- A general-purpose language model(**GPT series**)
- instruction tuned language models(**AllenNLP's**)
- dialogue-tuned language models(**Microsoft's DialoGPT**)
- Domain specific language models (**BioBERT**),**Bidirectional Encoder Representations from Transformers for Biomedical Text Mining**

How ChatGPT is Trained

Step 1

Collect demonstration data, and train a supervised policy.

A prompt is sampled from our prompt dataset.

A labeler demonstrates the desired output behavior.

This data is used to fine-tune GPT-3 with supervised learning.

Step 2

Collect comparison data, and train a reward model.

A prompt and several model outputs are sampled.

A labeler ranks the outputs from best to worst.

This data is used to train our reward model.

Step 3

Optimize a policy against the reward model using reinforcement learning.

A new prompt is sampled from the dataset.

The policy generates an output.

The reward model calculates a reward for the output.

The reward is used to update the policy using PPO.

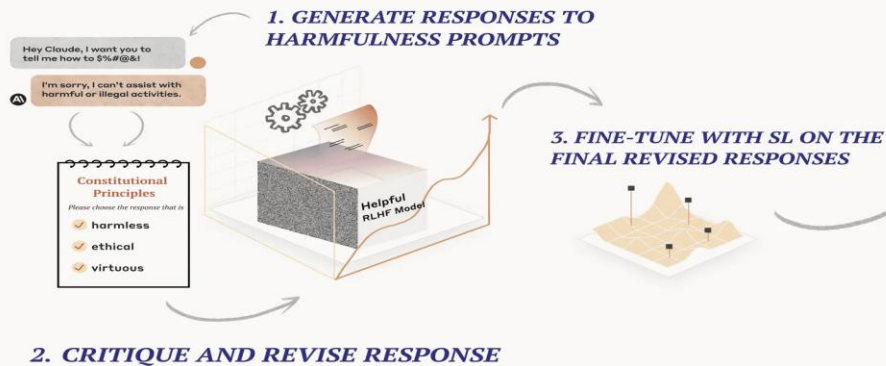

The Modern Upgrade: (Claude and GPT4o)

Constitutional AI (CAI)

1. Supervised Learning (SL) Stage

Revises harmful AI responses through iterative self-critique and fine-tuning.

2. Reinforcement Learning (RL) Stage

Uses AI evaluations of responses according to constitutional principles to generate preference data for harmlessness and uses it to train a new model via Reinforcement Learning from AI Feedback.

4. AI GENERATES DATASET OF PREFERENCES FOR HARMLESSNESS

4. TRAIN PREFERENCE MODEL

5. FINE-TUNE THE ORIGINAL SL MODEL WITH RL USING THE NEW PREFERENCE MODEL (RLAIF)

LLM Limitations

- **Knowledge of LLM constrained to pretraining data**

LLM Limitations

- **Knowledge of LLM constrained to pretraining data**

The screenshot shows the OpenAI GPT-5 model card interface. At the top, there is a '5' icon in a colorful square, followed by the text 'GPT-5' and a 'Default' dropdown menu. Below this, it says 'The best model for coding and agentic tasks across domains'. To the right are 'Compare' and 'Try in Playground' buttons. A central section displays five metrics: REASONING (4 full lightbulbs, 'Higher'), SPEED (3 lightning bolts, 'Medium'), PRICE (\$1.25 · \$10, 'Input · Output'), INPUT (text and image icons, 'Text, image'), and OUTPUT (text icon, 'Text'). Below the metrics, a paragraph states: 'GPT-5 is our flagship model for coding, reasoning, and agentic tasks across domains. Learn more in our [GPT-5 usage guide](#).' To the right of this paragraph is a list of features: '400,000 context window', '128,000 max output tokens', 'Sep 30, 2024 knowledge cutoff' (highlighted with a red box), and 'Reasoning token support'.

Other LLM Challenges

- ❑ Hallucination
- ❑ Lack of specialized information
- ❑ Lack of transparency
- ❑ Privacy & Security Risks
- ❑ Energy Consumption & Environmental Impact
- ❑ High Computational & Memory Costs

RAG: Motivations

RAG = **R**etrieval-**A**ugmented **G**eneration

- Domain-specific accurate answering
- Frequent updates of data
- Traceability and explainability of generated content
- Controllable Cost
- Privacy protection of data

Prerequisite: Create knowledge base

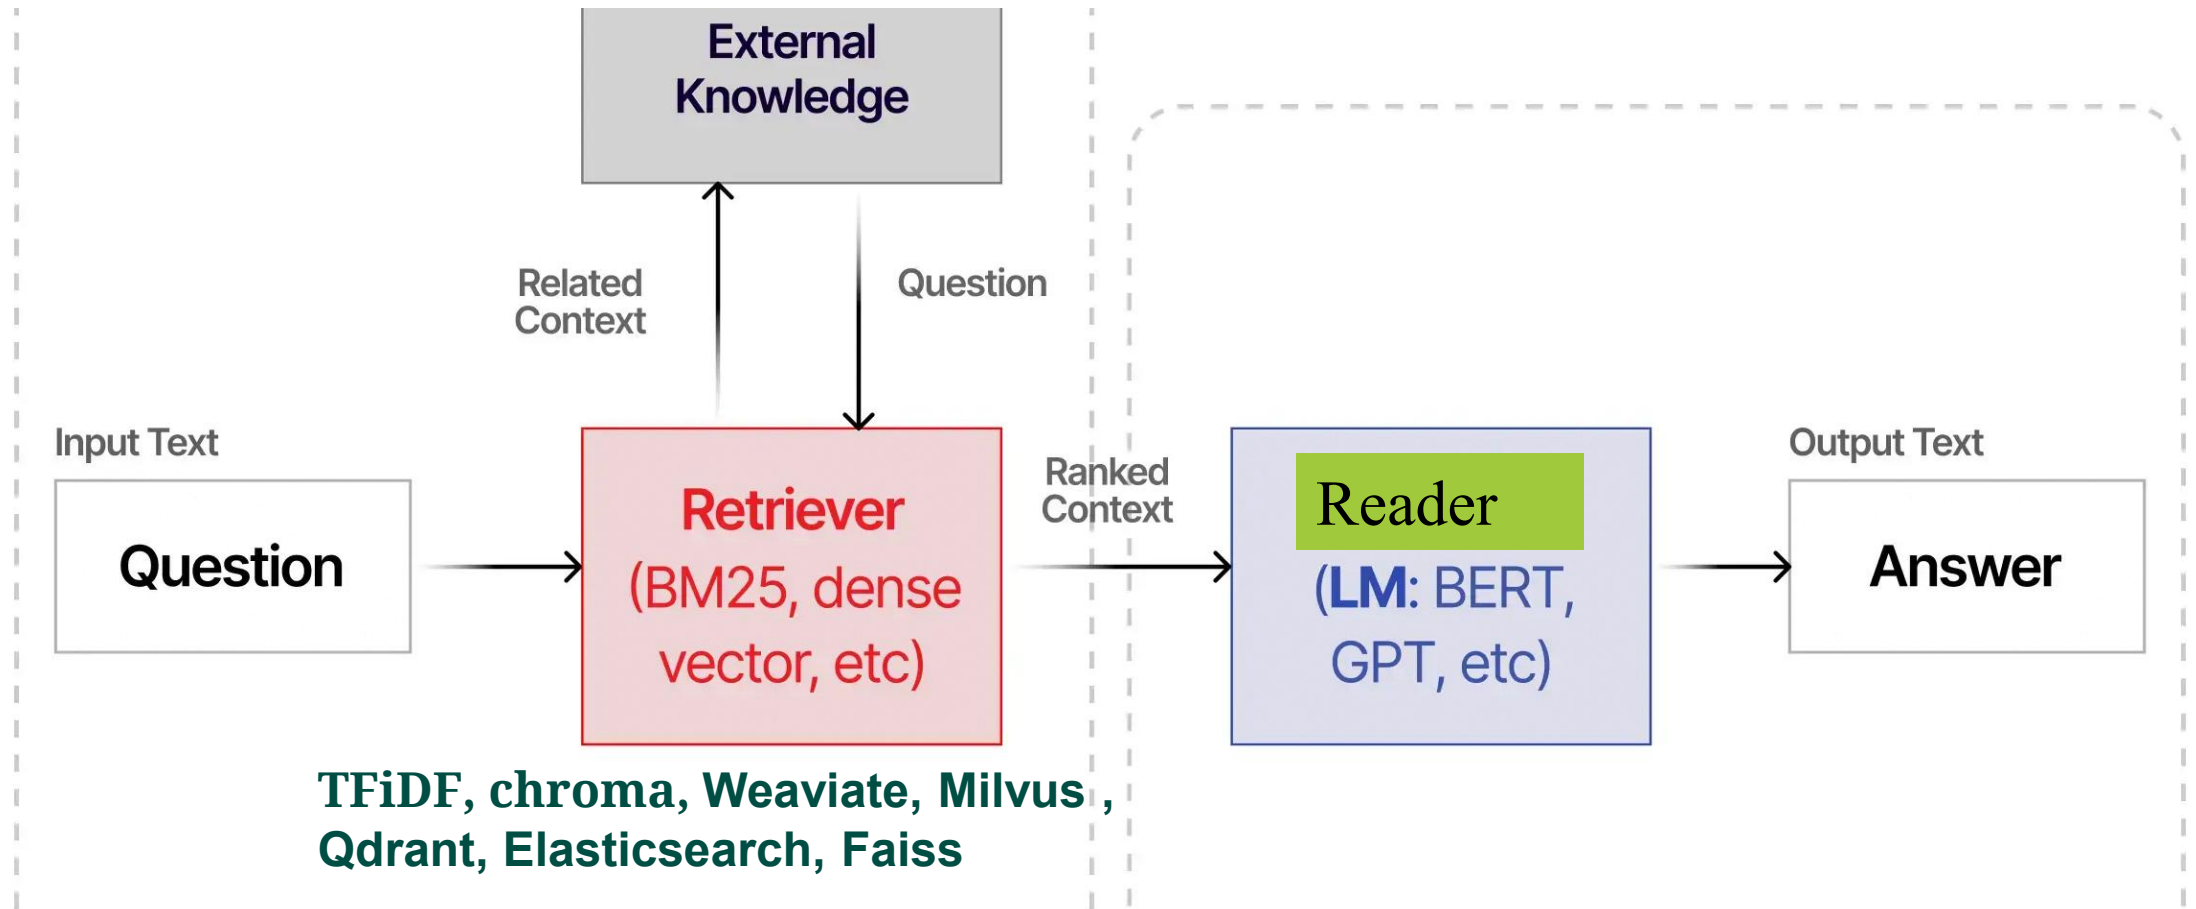

RAG systems

- Retrieval augmented generation **RAG**: Augmented LLM with specialized and mutable knowledge base

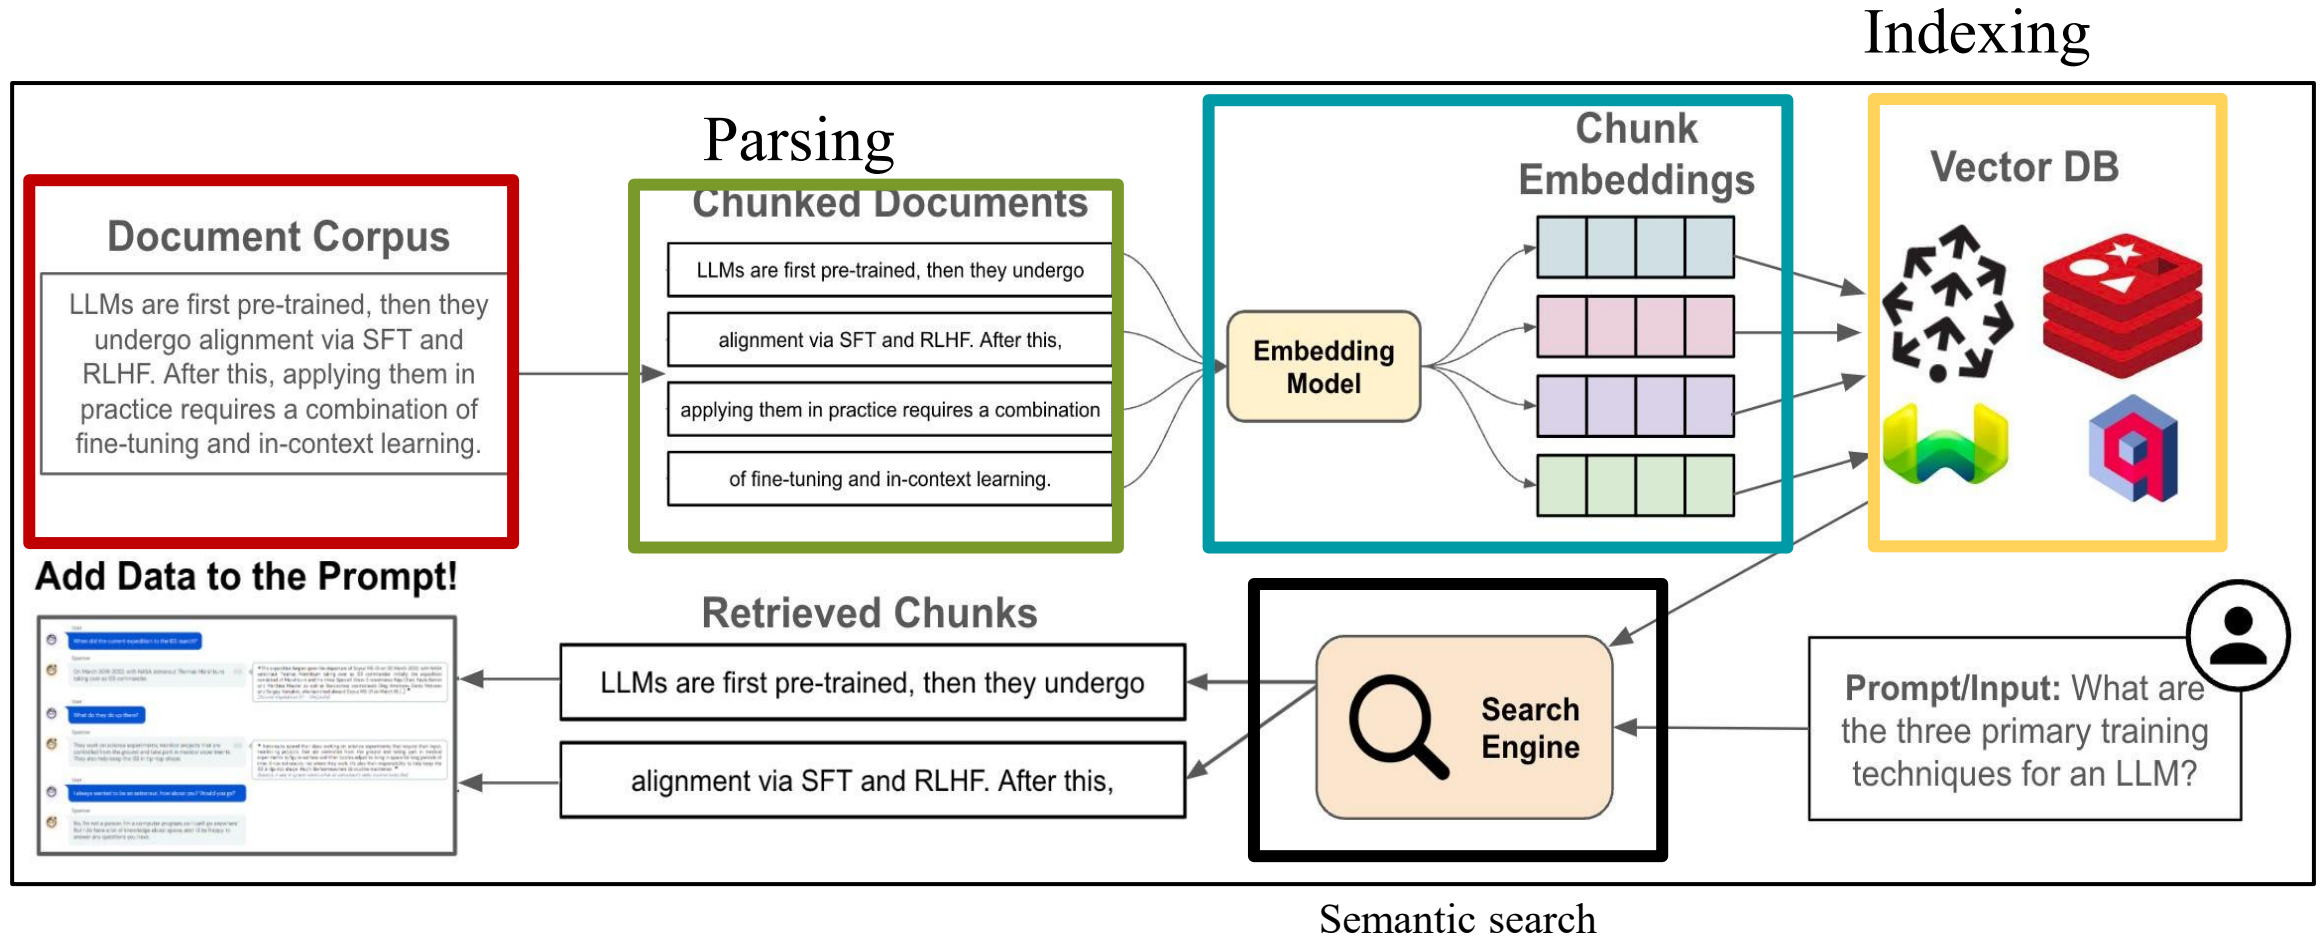

“Retrieval-Augmented Generation for Knowledge-Intensive NLP Tasks” (2020)

How RAG works

How RAG works...

Quantify performance of retrieval

Ranking

- Normalized Discounted Cumulative Gain at k (**NDCG@k**)

$$\text{DCG}@k = \sum_{i=1}^k \frac{\text{rel}_i}{\log_2(i+1)}$$

with $\text{rel}_i \in \{0, 1\}$

rel_i = relevance score at position i
• $\log_2(i+1)$ = penalty for lower ranks

$$\text{NDCG}@k = \frac{\text{DCG}@k}{\text{IDCG}@k}$$

$\text{DCG}@k$ if ranking was perfect

NDCG@k: Example

$$\text{DCG}@k = \sum_{i=1}^k \frac{\text{rel}_i}{\log_2(i+1)}$$

Rank	Chunk	Relevance (rel _i)
1	Chunk text 1	1
2	Chunk text 2	3
3	Chunk text 3	2
4	Chunk text 4	0
5	Chunk text 5	1

DCG

→

$$\begin{aligned} 1 / \log_2(2) &= 1 \\ 3 / \log_2(3) &= 1.89 \\ 2 / \log_2(4) &= 1 \\ 0 / \log_2(5) &= 0 \\ 1 / \log_2(6) &= 0.39 \\ \text{Total DCG} &\approx 4.28 \end{aligned}$$

→ The ideal Sorted
relevance: [3, 2, 1, 1, 0]

IDCG

↓

$$\begin{aligned} 3/1 &= 3 \\ 2/1.585 &= 1.26 \\ 1/2 &= 0.5 \\ 1/2.32 &= 0.43 \\ \text{Total IDCG} &\approx 5.19 \end{aligned}$$

←

$$\text{nDCG} = \text{DCG} / \text{IDCG} = 4.28 / 5.19 \approx 0.82$$

Quantify performance of retrieval...

Ranking

- Reciprocal Rank at k (RR@k)

$$RR = \frac{1}{\text{rank}}$$

rank of the first relevant chunk

Quantify performance of retrieval...

Ranking

- Recall at k

$$\text{Recall@}k = \frac{|\text{relevant in top } k|}{|\text{relevant}|}$$

Quantify performance of retrieval...

Ranking

- Precision at k

$$\text{Precision@}k = \frac{|\text{relevant in top } k|}{k}$$

Settings to keep in mind

- One important setting is controlling how deterministic the model is when generating completion for prompts
- **Temperature** and **top_p** are two important parameters to keep in mind
- Generally, keep these low if you are looking for exact answers
- keep them high if you are looking for more diverse responses

RAG Frameworks

- There are many tools, libraries, and platforms with different capabilities and functionalities
- Capabilities include:
 - Developing and experimenting with prompts
 - Evaluating prompts
 - Versioning and deploying prompts

OPEN Source MLL

◆ Core general-purpose models

OPEN Source MLL

 **8 GB RAM (Laptop / Low-End PC)**

Model	Size on Disk	Ollama Command
Llama 3.3 8B	4.9 GB	<code>ollama pull llama3.3:8b</code>
Mistral 7B	4.1 GB	<code>ollama pull mistral:7b</code>
DeepSeek R1 7B	~5 GB	<code>ollama pull deepseek-r1:7b</code>
Phi-4	~4 GB	<code>ollama pull phi4</code>

OPEN Source MLL...

 **16 GB RAM (Mid-Range Workstation)**

Model	Size on Disk	Ollama Command	Q&A Strength
DeepSeek R1 14B	~9 GB	ollama pull deepseek-r1:14b	Chain-of-thought Q&A
Qwen 2.5 14B	~9 GB	ollama pull qwen2.5:14b	Multilingual Q&A
Phi-4 14B	~8 GB	ollama pull phi4:14b	Analytical reasoning

Choosing a Platform to Run LLMs

Tools to Run and Host Open-source LLMs

Ollama

Hugging Face

LM Studio

Comparison between Ollama, vLLM, Hugging Face

Factor	Ollama	vLLM	Hugging Face
Ease of Use	Very user-friendly	Requires more technical setup	User-friendly with extensive docs
Performance	Optimized for smaller models	Highly optimized for large-scale models	Good performance with scaling options
Scalability	Limited	High	Scalable with managed services
Integration & Flexibility	Limited flexibility	High flexibility for advanced users	High flexibility, integration into multiple tools
Model Support	Popular open-source models	Popular open-source models	Extensive (Transformers, etc.)
Deployment	Local	Cloud/On-premise	Cloud/On-premise
Use Case	Ideal for small to medium-scale	Best for high-throughput, enterprise-level use	Great for research, fine-tuning, and both small and large-scale use
