

CST8509 Value Function Approx

Today's Agenda

- Review Quiz
- Value Function Approximation
- Add actors to Gazebo simulated worlds

Qlearning: example of Temporal Distance Learning

Monte Carlo: need to go all the way to the end of an episode, then can learn

Temporal Distance: time in RL is measured in steps

TD(0): Learn from looking **one** step ahead (state vs next-state):

$$qtable[state][action] = qtable[state][action] + \alpha * (reward + \gamma * \max(qtable[next_state]) - qtable[state][action])$$

qtable: the table of action-values approximating the action-value function

state: the current state

action: the current action

alpha: step size

reward: reward received from taking action in state

gamma: discount factor

next_state: the state resulting from taking action in state

Value Function Approximation: Large Scale problems

So far we have constructed a $qtable(state, action)$

- value for every state/action pair
- What about
 - Backgammon: 10^{20} states
 - Computer Go: 10^{170} states
- Cannot represent that whole $qtable$ explicitly

Value Function Approximation

Solution for large MDPs:

Estimate value function with function approximation

w is a vector of weights of a neural network

$$\hat{v}(s, w) \approx v_{\pi}(s)$$

or

$$\hat{q}(s, a, w) \approx q_{\pi}(s, a)$$

Generalize from seen states to unseen states

Update parameter w using MC or TD learning

Value function approximation and DQN

Q-Learning: learn Q , the action-value function $q(s,a)$

DQN: Deep Q-Network

DQN is similar to Q-learning except:

- No Q-table, we have Q-network instead
- Instead of updating Q-table, DQN trains Q-network
- Q-network implements an approximation of Q
- Input to Q-network is State, output is action values (same number of outputs as actions)

SB3 DQN Policy Architecture (MlpPolicy)

There are two of these neural networks: Online and Target:

DQN Online and Target Networks

Online Network: Actively updated via gradients during every training step to minimize the loss function (MSE based on temporal difference (TD) error).

Target Network: A lagged copy of the online network used to provide stable Q-value targets. It is updated less frequently using a hard update or soft update (Polyak update) governed by the (small) tau parameter.

DQN Loss Function

$$L = E[(r + \gamma * \max Q_{target(s',a')} - Q_{online(s,a)})^2]$$

DQN Algorithm

DQN training

Interaction: Agent collects (s, a, r, s') transitions from the environment.
“learning_starts” are done before training

Replay Buffer: Transitions are stored to break temporal correlations.

Optimization: Online Q-Network trains on random batches from the buffer.
Done by default every 4 interactions (after learning_starts)

Target Update: Weights are copied to the Target Network for stability. Done every 10000 steps by default.

PPO and value function approximation

- PPO has an Actor Network and a Critic Network (Value function)

Left

$$r = \frac{P_c}{P_o}$$

$$\log(r) = \log\left(\frac{P_c}{P_o}\right)$$

$$\log(r) = (\log(P_c) - \log(P_o))$$

$$r = e^{(\log(P_c) - \log(P_o))}$$

Right

Reinforce

Step 7 Optimize Actor Network

$$L^{CLIP}(\theta) = \mathbb{E}_\tau \left[\min \left(r_t(\theta) \hat{A}_t, \text{clip}(r_t(\theta), 1 - \epsilon, 1 + \epsilon) \hat{A}_t \right) \right]$$

$$r = \frac{\text{action prob current}}{\text{action prob old}} \cdot A = \frac{0.25}{0.25} \cdot A$$

$$(0.8 \leq r \leq 1.2) \cdot A = 1 \cdot A$$

Step 8 Repeat 6 & 7 for n

Step 9 Repeat 3-8 for T

Actor Network / Policy / Model

state

Step 1 Init Actor Network

Step 3 Collect a batch of trajectories

a) $\rightarrow$
b) $\uparrow$
c) $\leftarrow$

state, action, prob, reward, value, RTG

a) (7, $\rightarrow$, $\log(0.25)$, -100, -50, -100)
b) (7, $\uparrow$, $\log(0.25)$, -1, -50, -3.4)
c) (7, $\leftarrow$, $\log(0.25)$, -1, -50, -4.1)

Step 4 Calc Rewards to go

$$Rtg = R_t + \gamma R_{t+1} + \gamma^2 R_{t+2} + \dots$$

$Rtg_a = -100$
 $Rtg_b = -1 + 0.9(-1) + 0.9^2(1) + 0.9^3(-1) = -3.4$
 $Rtg_c = -1 + 0.9(-1) + 0.9^2(-1) + 0.9^3(-1) + 0.9^4(1) = -4.1$

Step 5 Calc Advantages

$$A(s, a) = Q(s, a) - V(s)$$

a) $A(7, \rightarrow) = Q(7, \rightarrow) - V(7) = -100 - (-50) = -50$
b) $A(7, \uparrow) = -3.4 - (-50) = 46.6$
c) $A(7, \leftarrow) = -4.1 - (-50) = 45.9$

Step 6 Optimize Critic Network

$$\text{loss} = \frac{1}{3} \sum_{i=1}^3 (y_i - \hat{y}_i)^2$$

Step 2 Init Critic Network

Value V

-50 $\rightarrow$ MSE

Actors in Gazebo worlds

Details here: <https://gazeboosim.org/docs/harmonic/actors>

Skeletal animation: arms and legs move (for example)

Trajectory animation: actor moves in world

Red Ball to follow

Simple box following trajectory can be adapted to red ball:

<https://classic.gazebosim.org/tutorials?tut=actor>

```
<actor name="animated_ball">
  <link name="link">
    <visual name="visual">
      <geometry>
        <sphere>
          <radius>.2</radius>
        </sphere>
      </geometry>
      <material name="red">
        <ambient>1 0 0 1</ambient>
        <diffuse>1 0 0 1</diffuse>
        <specular>0 0 0 0</specular>
        <emissive>0 0 0 1</emissive>
      </material>
    </visual>
  </link>
```

Red Ball trajectory

```
<script>
  <loop>true</loop>
  <delay_start>0.000000</delay_start>
  <auto_start>true</auto_start>
  <trajectory id="0" type="square">
    <waypoint>
      <time>0.0</time>
      <pose>1 -1 1 0 0 0</pose>
    </waypoint>
    <waypoint>
      <time>1.0</time>
      <pose>1 1 1 0 0 0</pose>
    </waypoint>
    <waypoint>
      <time>2.0</time>
      <pose>1 1 1 0 0 0</pose>
    </waypoint>
    <waypoint>
      <time>3.0</time>
      <pose>1 -1 1 0 0 0</pose>
    </waypoint>
    <waypoint>
      <time>4.0</time>
      <pose>1 -1 1 0 0 0</pose>
    </waypoint>
  </trajectory>
</script>
</actor>
```

Add to AWS small house

Can place the code for the red ball actor in

```
~/create3_ws/src/aws-robomaker-small-house-world/worlds/small_house.world
```

Let's also try adding the humanoid actor from the café world

Reinforcement Learning /w red ball

Similar to having the create3 follow the index finger

Have create3 follow red ball in simulation

Assignment 2:

- need gymnasium environment
 - This environment creates ROS 2 node
 - Step function publishes Twist message to cmd_vel
 - Return reward and new state (image or just offset?)
